1. Pullback in hog prices brings a much needed correction to the market and should bolster wholesale pork demand going into spring.

The drop in lean hog futures this week was swift as market participants reacted to a deterioration in pork product prices and the resulting negative impact this had on packer margins. On

Friday the April Lean Hog futures contract settled at \$68.15/cwt, down 12% compared to where it was at the start of the year. The pork cutout in late January was quoted as high as \$83/cwt (Jan 23), 2% higher than the previous year despite a net increase in pork supplies. On Friday the cutout was quoted at \$77.34/cwt. The surge in pork prices during January was due to higher

prices for pork shoulders (butt/picnic) and hams.

Higher ham prices were not a surprise given that Easter this year is two weeks earlier than a year ago. Strong export orders from Asia also helped support prices for pork butts. Strong demand for pork during the holidays, including demand from exports, supported prices above the 5-yr seasonal trend line (see chart on page 1). It can be argued, however, that January prices were not sustainable and a much needed correction was in order. Hog slaughter in March and April is expected to run between 2.35 and 2.4 million hogs, numbers that in the past we used to see in the fall. Despite talk of PEDv winter losses, we don't think there is a shortage of hogs on the ground. Hog weights are now running significantly above year ago levels, an indication that producers are probably less current than they would like to be. When packers were making money back in January this was not that big of a concern. However, the meat margin (difference between cutout and hog price) has declined from near \$40/head at the start of the year to around \$6/cwt currently. In this situation, packer bids have softened considerably.

There is broad agreement among producers and analysts that pork supplies will continue to expand this year, the debate is only about "how much". In its last forecast report USDA analysts indicated they expect pork production in 2018 to increase by 5% compared to a year ago. We are not quite as aggressive in our projections and currently forecast pork production to increase by 3.5% this year. **In this environment of plentiful pork supplies, the recent decline in hog prices should be seen as beneficial for the spring market.** Lower prices are critical in helping push more pork through retail and

export channels. The low price of pork loins appears to have bolstered retail features (see chart to the right) and we expect to see more of this

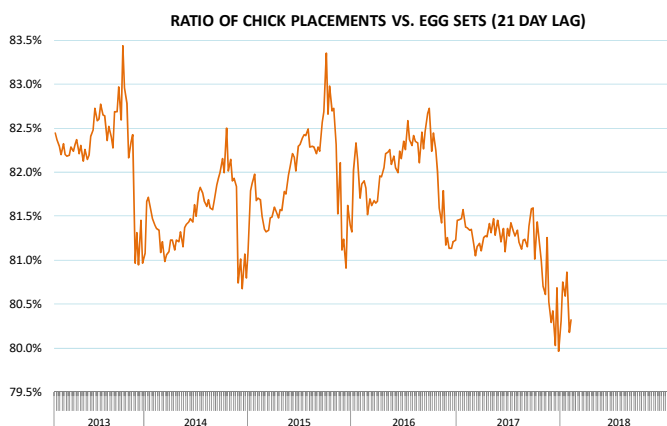

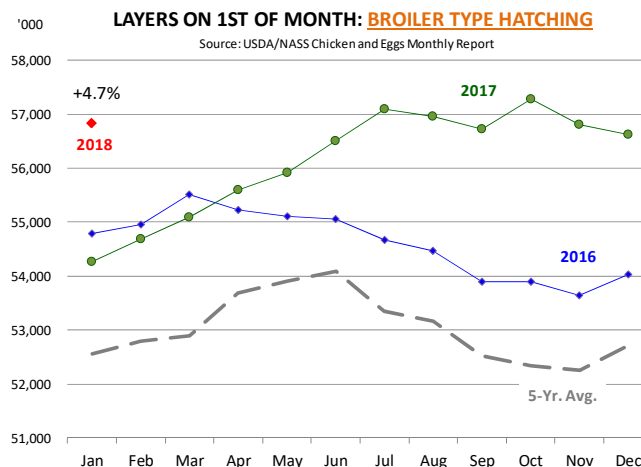

into the spring. We continue to think, and data so far appears to support this, that overall pork demand remains very good. The recent declines reflect a market that got a bit ahead of itself and ran into normal seasonal weakness (see chart on page 1). As demand seasonally improves and hog slaughter declines, we expect to see a resurgence in pork prices.

Key items to watch in Q2:

- Ham demand from Mexico should continue to provide support. Prices briefly dropped in the mid 50s last week but quickly recovered, we think because of new domestic and export orders
- Primal belly prices should be in the \$130-140 range by April and higher into June/July. Higher belly stocks are expected to limit the upside and avoid another trip to the \$200 area we saw in July 2017.

2. Broiler supply and pricing outlook

We are generally in agreement with USDA in terms of the outlook for broiler supplies in 2018. Our current forecast is for broiler production to increase by 2.3% in 2018 while USDA is forecasting production to increase by 2.5%. Part of the reason for the divergence may have to do with our forecasts for broiler weights, which are expected to increase only modestly in 2018. The broiler hatching flock is currently much higher than a year ago but it is expected to be only steady going into the spring. There are a number of reasons for the increase in the hatching flock but we think pri-

marily it has to do with the sharp decline in productivity. As a larger percentage of US broiler production comes from NAE flocks (no antibiotics ever), this has meant a lower egg-chick conversion. The ratio of chick placements vs. eggs set in incubators currently stands at 80% compared to 81.5% for the same period a year ago and 82% average for the years 2013—2016.

We expect dark meat prices to outperform breast meat in 2018, in part because of a shift in demand but also due to higher labor costs and strong demand from exports. Leg quarter prices are forecast to increase by 10% y/y in 2018 while breast meat prices are forecast increase by 5%. Whole bird prices expected to up 2%.
